

Amy Luscombe

Amy Luscombe is a sustainability change agent, embedding environmentally and socially beneficial outcomes into organisations' standard operational space and practice with energy and vision.

Embedding Sustainability – A Unique Approach

Amy believes that organisations need to take responsibility for their sustainability journey through their own internal processes and mechanisms. Amy's integrated and holistic approach to implementing and embedding sustainability in your organisation aims to empower and excite your people, leading to long-term organisational change and generating internal passion for improved sustainability performance.

To Amy, sustainability is about balance and harmony - achieving the most environmentally and socially beneficial outcomes in relation to your product and/or market.

Amy believes that the skills and knowledge required for sustainability change already exist in an organization. It is Amy's role to connect, energize, strategize and mobilize within and beyond the operational parameters of the organisation. Amy uses creativity and innovation in assessing and developing appropriate and tailored methodologies and frameworks for sustainability education, engagement, communication, behavioural change and measurement of environmental and social impact.

Background

Amy has a diverse background in environmental management and consulting across a range of industries and sectors from small organisations (including not for profit) to ASX100 companies, including heavy manufacturing, food & beverage, utilities, mining, construction and infrastructure, finance, ecotourism, agriculture and primary industry.

Particularly, Amy has consulted on and led projects in climate change and greenhouse gas assessment, environmental management, environmental impact assessment, sustainable building planning and assessment, waste management and corporate responsibility implementation and reporting. Additionally, Amy was the in-house sustainability advisor at BlueScope Steel for two years where she was responsible for sustainability education and engagement, development of Life Cycle inventories and methodologies, CPRS impact modelling, and national representation of the Australian Steel Institute on committees and working groups.

Amy is a qualified environmental scientist with a social passion, majoring in Asia-Pacific Development and Human Geography. Having completed a Masters of Environmental Law in 2004, Amy has a sound applied knowledge of the

environmental regulatory environment, and of the need to future-proof an organisation for developments in environmental/social law and policy.

Amy has developed and presented national workshops and training in sustainability and climate change for the steel industry, and has prepared and delivered community and corporate workshops and presentations in sustainability engagement and education.

Amy has recently undertaken a Masters of Education in Social Ecology to extend her environmental expertise into social and community applications, and to integrate transformative leadership, life-long learning and behavioural science into change for sustainability.

Core Capabilities

- Environmental Management & Strategy
- Climate Change & Greenhouse Gas Management
- Corporate Social Responsibility (CSR) & Sustainability Reporting
- Environmental and Social Governance (ESG)
- Life Cycle Management & Sustainable Supply Chain
- Sustainability Communications
- Leadership and Change for Sustainability
- Education and Innovation for Sustainability

Qualifications
